USDL 04-436 TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EST), THURSDAY, MARCH 18, 2004*

Producer Price Indexes -- January 2004

The Producer Price Index for Finished Goods advanced 0.6 percent in January, seasonally adjusted, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. This increase followed a 0.2-percent gain in December and a 0.2-percent decline in November. Rising prices for gasoline led the increase in the finished goods index in January. At the earlier stages of processing, prices received by manufacturers of intermediate goods moved up 0.8 percent in January, after rising 0.4 percent in the prior month. The crude goods index increased 2.8 percent, compared with a 2.2-percent rise in December. (See table A.)

Table A. Monthly and annual percent changes in selected stage-of-processing price indexes, seasonally adjusted

Month	Total	Foods	Energy	Except foods and energy	Change in finished goods from 12 months ago (unadj.)	Inter- mediate goods	Crude goods
2003					•

2004							
Jan.	.6	-1.4	4.7	.3	3.3	.8	2.8

NOTE: Some of the percent changes shown here and elsewhere in this release may differ from those previously reported because seasonal adjustment factors have been recalculated to reflect developments during 2003. In addition, indexes for September 2003 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

Among finished goods, the index for finished energy goods jumped 4.7 percent in January, following a 1.6-percent advance in the previous month. Excluding prices for gasoline, the finished goods index rose 0.2 percent in January. Prices for finished goods other than foods and energy increased 0.3 percent, after edging down 0.1 percent in the preceding month. By contrast, the finished consumer foods index dropped 1.4 percent in January, after inching up 0.1 percent a month earlier.

Before seasonal adjustment, the Producer Price Index for Finished Goods advanced 0.6 percent to 145.4 (1982=100). From January 2003 to January 2004, finished goods prices rose 3.3 percent. During the same period, the indexes for finished energy goods, finished consumer foods, and finished goods other than foods and energy moved up 11.4, 4.2, and 0.9 percent, respectively. At the earlier stages of processing, prices for intermediate goods increased 3.8 percent for the 12 months ended in January 2004, while the index for crude goods jumped 13.7 percent.

Finished goods

Prices for finished energy goods increased 4.7 percent in January, after registering a 1.6-percent gain in the prior month. Leading this acceleration, the gasoline index surged 14.1 percent, following a 3.4-percent rise in December. Prices for home heating oil and liquefied petroleum gas also advanced at a faster rate in January than they did a month earlier. The index for residential natural gas turned up, following a decline in the previous month. On the other hand, the rate of increase for residential electric power prices slowed from 0.5 percent in December to 0.1 percent in January.

NOTE: Some of the percent changes shown here and elsewhere in this release may differ from those previously reported because seasonal adjustment factors have been recalculated to reflect developments during 2003. In addition, indexes for September 2003 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

The index for finished consumer goods other than foods and energy turned up 0.3 percent in January, compared with a 0.1-percent decrease in the preceding month. Light motor truck prices increased 1.1 percent, following a 1.7-percent decline in December. The indexes for passenger cars, periodical circulation, and for sporting and athletic goods also advanced in January, after decreasing a month earlier. Prices for pharmaceutical preparations and book publishing rose more in January than they did in the previous month, while the cigarettes index increased, after showing no change in December. Alternatively, household furniture prices inched down 0.1 percent in January, following a rise of the same magnitude in the prior month.

Subsequent to a 0.1-percent decrease in December, the capital equipment index advanced 0.3 percent in January. The indexes for light motor trucks and passenger cars turned up, following declines in December. Prices for heavy motor trucks, construction machinery and equipment, and civilian aircraft rose at a faster pace in January than they did a month earlier, while the truck trailers index moved up after showing no change in the preceding month. By contrast, commercial furniture prices fell 0.4 percent in January, compared with a 0.1-percent gain in the prior month. The integrating and measuring instruments index also turned down, following an increase in December. Prices for x-ray and electromedical equipment fell more than they did in the previous month.

Prices for finished consumer foods decreased 1.4 percent in January, following a 0.1 percent increase a month earlier. Leading this downturn, the index for fresh and dry vegetables dropped 20.9 percent, following a 20.7-percent upsurge in December. Prices for eggs for fresh use also fell, after rising in the prior month. The beef and veal index declined at a faster rate than it did in the previous month. Prices for citrus fruits rose less in January than they did in December. By contrast, the index for soft drinks advanced 1.9 percent, compared with a 0.7-percent decrease in the preceding month. Prices for pork and bakery products also turned up in January, following declines a month earlier. The indexes for processed young chickens, finfish and shellfish, and shortening and cooking oils rose at a quicker pace than they did in December.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components climbed 0.8 percent in January, compared with a 0.4-percent advance in December. Prices for intermediate energy goods, materials for nondurable manufacturing, and materials for durable manufacturing increased at a faster rate in January than they did in December. The index for materials and components for construction turned up, after edging down in the preceding month. On the other hand, the index for intermediate foods and feeds fell at a quicker pace in January than it did a month earlier. Excluding foods and energy, prices for intermediate materials advanced 0.6 percent, after inching up at a 0.1-percent rate in December. (See table B.)

The index for intermediate energy goods jumped 2.7 percent in January, following a 1.8-percent increase in December. A surge in gasoline prices of 14.1 percent followed a 3.4-percent increase in December. The indexes for home heating oil, jet fuel, liquefied petroleum gas, and diesel fuel also advanced at a faster pace than they did in the prior month. Prices for industrial natural gas turned up in January, while the index for industrial electric power fell less than it did in December. By contrast, prices for natural gas to electric utilities declined 6.2 percent in January, compared with a 4.8-percent gain in the previous month. The indexes for commercial electric power and commercial natural gas also turned down in January.

Prices for materials for nondurable manufacturing climbed 1.3 percent in January, following a 0.4-percent increase in December. The index for liquid refinery gases surged 16.2 percent, after rising 7.4 percent in the previous month. The indexes for plastic resins and materials, inedible fats and oils, medicinal and botanical chemicals, and gray fabrics moved up in January, following declines in December. On the other hand, paperboard prices decreased 1.2 percent in January, after inching up at a 0.1-percent rate a month earlier. The index for nitrogenates also turned down, while prices for paper fell more than they did in the preceding month.

The index for materials and components for construction increased 0.3 percent in January, compared with a 0.1-percent decline in December. Softwood lumber prices jumped 1.5 percent in January, following a 0.3-percent decrease in the prior month. The indexes for wiring devices, hardwood lumber, and prefabricated wood buildings and components also rose, after falling in December. Prices for fabricated structural metal products, steel mill products, plastic construction products, and millwork advanced at a quicker rate than they did in the preceding month. Alternatively, the index for concrete products edged up 0.1 percent in January, following a 0.5-percent gain in December. Plywood prices fell more than they did a month earlier, while the indexes for gypsum products and for air conditioning and refrigeration equipment turned down in January.

Prices for materials for durable manufacturing climbed 1.0 percent in January, after posting a 0.5-percent gain in December. The index for primary nonferrous metals jumped 4.3 percent, following a 2.4-percent rise in the previous month. Prices for copper and brass mill shapes; semifinished steel mill products; cold finished steel bars; and hot rolled steel bars, plates, and structural shapes also increased more than in December. The indexes for hardwood lumber and industrial textile products advanced, following December declines. Conversely, prices for aluminum mill shapes turned down 0.4 percent in January, after inching up at a 0.1-percent rate a month earlier. The index for plywood fell more quickly in January, while prices for cold rolled steel sheet and strip rose more slowly than they did in the prior month.

The index for intermediate foods and feeds fell 1.0 percent in January, compared with a 0.5-percent decrease in December. This faster rate of decline can be attributed mainly to prices for beef and veal products, which dropped 11.0 percent in January after a 5.6-percent decrease in December. In addition, the indexes for fluid milk products and for portion control meat and meat-type products also fell at a quicker pace, while prices for confectionery materials and liquid milk products rose at a slower rate in January than they did a month earlier. The indexes for flour and for refined sugar and sugar byproducts turned down, after rising in December. By contrast, prepared animal feed prices advanced 0.2 percent, after declining 0.4 percent in the previous month. The pork index also turned up in January. Prices for shortening and cooking oils and processed young chickens increased more in January than they did in December.

Crude goods

The Producer Price Index for Crude Materials for Further Processing advanced at a 2.8-percent rate in January, after posting a 2.2-percent gain in December. Price increases for crude energy materials were larger in January than in December and outweighed larger price decreases for crude foodstuffs and feedstuffs. In addition, the index for basic industrial materials rose at a slightly faster pace than it did in December. (See table B.)

The index for crude energy materials climbed 12.5 percent in January, following a 4.3-percent increase in December. Natural gas prices led the acceleration by surging 17.8 percent, after advancing 6.1 percent in the previous month. The index for crude petroleum rose 8.1 percent in January, compared with a 2.6-percent gain a month earlier. On the other hand, coal prices dropped 1.6 percent, subsequent to a 0.4-percent rise in December.

The index for crude nonfood materials less energy gained 3.3 percent in January, its eighth consecutive increase, after rising 3.0 percent in December. The index for raw cotton increased 6.8 percent, following a 10.1-percent decline in the prior month. Prices for wastepaper also turned up, while indexes for aluminum base scrap and construction sand, gravel, and crushed stone rose more in January than they did in December. Conversely, the rate of increase for iron and steel scrap prices slowed from 8.8 percent in December to 5.7 percent in January. Prices for copper ores, gold ores, and copper base scrap also rose less in January than they did in the prior month.

The index for crude foodstuffs and feedstuffs fell 6.9 percent in January, following a 0.2-percent drop in December. January prices for slaughter cattle declined 17.4 percent, after slipping 3.5 percent the preceding month. Indexes for fresh vegetables (except potatoes), slaughter broilers and fryers, and wheat turned down in January. By contrast, prices for fluid milk fell 1.4 percent in January, after dropping 7.7 percent in December. The January index for slaughter turkeys rose more than in December, as did the indexes for corn, soybeans, and Irish potatoes for further processing. Unprocessed shellfish prices rose after falling.

Net output price indexes for mining, manufacturing, and services industries

Mining. The Producer Price Index for the Net Output of Total Mining Industries rose 11.3 percent in January, following a 4.2-percent increase in December. (Net output price indexes are not seasonally adjusted.) Prices received by the oil and gas extraction industry group jumped 16.0 percent, after advancing 5.2 percent in the prior month. The industry group indexes for metal ore mining and coal mining also increased at a quicker rate than they did a month earlier. Prices received by the mining support activities industry group rose in January. In January, the Producer Price Index for the Net Output of Total Mining Industries was 141.6 (December 1984=100), 12.4 percent above its year ago level.

Manufacturing. The Producer Price Index for the Net Output of Total Manufacturing Industries increased 0.9 percent in January, after showing no change in the previous month. Prices received by the petroleum and coal products industry group rose 11.8 percent, compared with a 1.4-percent gain in the preceding month. The industry group indexes for chemicals, fabricated metal products, aerospace products and parts, and primary metals also advanced at a quicker rate than they did in December. Prices received by the automobile and light duty motor vehicle industry turned up, after falling in the prior month. By contrast, the industry group index for food manufacturing dropped 1.0 percent in January, after registering a 0.5-percent decline a month earlier. The industry group index for semiconductors and other electronic components also fell more than it did in the preceding month. Prices received by the industry group for communications equipment turned down in January, following gains in the previous month. The plastics and rubber products industry group index showed no change, after rising in December. In January, the Producer Price Index for the Net Output of Total Manufacturing Industries was 138.9 (December 1984=100), 2.4 percent above its year ago level.

Services. Among service industries in January, prices received by the industries for general medical and surgical hospitals, portfolio management, offices of physicians (except mental health), direct property and casualty insurance carriers, nursing care facilities, couriers, and newspaper publishers increased. Conversely, prices received by the industries for scheduled passenger air transportation, television broadcasting, lessors of nonresidential buildings (except miniwarehouse), software publishers, radio stations, passenger car rental, and long distance general freight trucking (truckload) fell in January.

The Producer Price Index data for January 2004 in this release were originally scheduled for release on Feb. 19, 2004.

The date of release for the February 2004 Producer Price Index data, originally scheduled for March 12, 2004, will be announced as soon as possible.

* Footnotes were added to tables 3 and 4 on March 26, 2004. For more information, see http://www.bls.gov/ppi/notice03262004.htm.

NAICS Conversion

The net output price indexes have been converted from the 1987 Standard Industrial Classification (SIC) basis to the 2002 North American Industry Classification System (NAICS) basis with the release of January 2004 indexes. The NAICS conversion involves major definitional changes to many of the currently published SIC-based indexes. SIC-based indexes are no longer produced or published. Historical index data based on the NAICS publication structure are available depending on the scope of the definitional changes between SIC and NAICS. A concordance between the two structures is available at http://www.bls.gov/ppi/ppinaics.htm through a World Wide Web site.

For more information contact the Division of Industrial Prices and Price Indexes, Section of Index Analysis and Public Information at *ppi-info@bls.gov* or (202) 691-7705.

Recalculation of Seasonal Adjustment Factors

Effective with this release, seasonal adjustment factors have been recalculated to reflect price-movement patterns during 2003 for stage-of-processing (SOP) and commodity-grouping indexes. This routine annual recalculation may affect previously published seasonally adjusted indexes and percent changes for January 1999 through December 2003. To request this information, contact the Division of Industrial Prices and Price Indexes, Section of Index Analysis and Public Information at ppi-info@bls.gov or (202) 691-7705.

The table below provides monthly seasonally adjusted percent changes for the three major SOP categories during 2003, based on former and recalculated seasonal factors. These percent changes include final price data through August 2003 and may differ from values shown elsewhere in this release.

Over-the-month percent changes in major stage-of-processing indexes, seasonally adjusted, using former and recalculated seasonal factors for 2003

	Fini	shed Goods	Interm	nediate Goods	Crude Goods

Resampling of Industries

Effective with this release, the Producer Price Index (PPI) includes data for 65 resampled and 21 newly introduced industries classified according to the North American Industry Classification System (NAICS). The Bureau of Labor Statistics periodically updates the sample of producers providing data for the PPI to reflect current conditions more accurately when the structure, membership, technology, or product mix of an industry shifts. The first results of this systematic process were published in July 1986. Subsequent efforts have been completed at 6-month intervals.

For information on specific index additions, deletions, and recodes that are effective with this semiannual update, see the January 2004 issue of the *PPI Detailed Report* or contact the Division of Industrial Prices and Price Indexes, Section of Index Analysis and Public Information at *ppi-info@bls.gov* or (202) 691-7705.

^{*} For further discussion of these newly introduced PPIs, see "New Producer Price Indexes for Electric Power Generation, NAICS 221110, and Electric Bulk Power Transmission and Control, NAICS 221121" and "PPI Introduces Industries to Complete Coverage of the Retail Trade Sector" in the January 2004 issue of the *PPI Detailed Report*, or call the Section of Index Analysis and Public Information at (202) 691-7705.

Brief Explanation of Producer Prices Indexes

The Bureau of Labor Statistics (BLS) term Producer Price Index (PPI) refers to a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI); CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 8,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

Commodity Indexes

The commodity classification structure of the PPI organizes products by similarity of end use or material composition, disregarding industry of origin. Fifteen major commodity groupings (2-digit commodity codes) make up the All Commodities Index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8 digit). Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes and corresponding percent changes will be virtually identical to their industry-based counterparts, even if their index levels differ.

Industry Net-Output Price Indexes

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes); indexes for Census product classes (7- and 8-digits), products (9-digits), and more detailed subproducts (11-digits); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Data Collection

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted primarily through the mail.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of unit dollar prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced industries includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

Weights

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 1997 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1996 through December 2001, PPI weights were derived from 1992 shipment values. Industry indexes also are now calculated with 1997 net output weights. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities, are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. This document can be downloaded from the BLS website at (http://www.bls.gov/opub/hom/homch14 itc.htm), and reprints are available on request.

Calculating Index Changes

Each PPI measures price changes from a reference period which equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars, as follows: Prices received by domestic producers of a sample of finished goods have risen from \$100 in 1982 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

Seasonally Adjusted and Unadjusted Data

3.4

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy, because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, available on request from the BLS.)

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is re-evaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (6-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information relating to seasonal adjustment methods, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

Producer Price Index Data Via the Internet

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, usage of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 1.6 million accesses of PPI series over the Internet during the 12 months ended December 31, 2003.

Retrieving PPI data from the PPI Website

PPI data can be obtained from the WWW address (http://www.bls.gov/ppi). Scrolling down the page to the "Get Detailed Statistics" header reveals the following 5 methods of data retrieval:

- *Most Requested Series* is a form-based application that allows the user to quickly obtain PPI time series data by selecting from two separate lists (commodity and industry) of the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.
- Create Customized Tables is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides a user through the PPI classification system by listing index titles and does not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user's browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple screen, nonJava-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Using the one-screen option, users can modify the date range and output options after executing the query using the reformat button above the data output table.
- **Series Report** is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at one time.

There are three basic formats for creating a unique PPI time series identifier. For commodity and stage-of-processing indexes, enter a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted) in combination with a commodity-based code to create a series identifier.

Commodity code wps063 wpu063803 wpusop3000 Will provide data for:

Drugs and pharmaceuticals, seasonally adjusted Pharmaceutical preparations, cardiovascular system Finished goods, not seasonally adjusted For a current industry-based price index organized according to the North American Industry Classification System (NAICS), enter the prefix "pcu" followed by the industry-product code. The series identifier for products primary to an industry include 12 numeric digits, the six-digit industry code is repeated, and up to seven additional digits of product detail. Dashes are used as place holders for higher-level industry group codes.

Industry-product code,	Will provide data for:
Current NAICS series	
pcu325325	Chemical manufacturing, not seasonally adjusted
pcu336110336110	Automobile and light duty motor vehicle manufacturing
pcu621111621111411	Offices of physicians, one and two physician practices and single specialty group practices,
	general/family practice

To identify a discontinued industry-product code based on the Standard Industrial Classification (SIC), enter a "pdu" prefix and "#" between the fourth and fifth characters of the product code. A series identifier for the discontinued dataset uses underscores as placeholders to complete a reference to an SIC industry group code of less than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of the NAICS.) *In all cases, no spaces are permitted.*

Industry-product code, Discontinued SIC series	Will provide data for:
pdu28 #	Chemicals and allied products, not seasonally adjusted
pdu331_#	Blast furnaces, steel works, and rolling and finishing mills, not seasonally adjusted
pdu3711#111	Passenger cars

• *Flat Files* and the FTP server are best suited for those users requiring access to either a large volume of time series data or other PPI-related documentation (such as, seasonal factor and relative importance tables). The FTP site can be accessed at (ftp://ftp.bls.gov) or directly from the links on the "Get Detailed Statistics" page or the PPI homepage. Data and documentation available for download include:

Directory:
NAICS Current Series
SIC Discontinued Series
Commodity Series
Special Requests
Latest News Release
Directory:
/pub/time.series/pc
/pub/time.series/wp
/pub/special.requests/ppi
/pub/news.release/ppi.txt

The FTP site maintains files to help with searches and downloads. These files are centrally located in the /pub/doc directory. Within this directory, go to the overview.txt file for an overview relating to all BLS data available through the FTP site. For commodity-based PPI data (which appear in tables 1, 2, 3, 6, 7, and 8 of the PPI monthly detailed report and tables 1, 2, 3, and 5 of the monthly news release), the program help file is wp.txt. For current industry-based PPI data based on the NAICS (which appear in tables 4, 5, and 9 of the monthly PPI report and table 4 of the monthly news release), the file is pc.txt. For industry-based SIC time series that have been discontinued, go to pd.txt. (These and other help files are also maintained within each of the five directories listed above.)

Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (http://www.bls.gov). After clicking the "Get Detailed Statistics" link at the top of the homepage a chart appears listing all of the available BLS programs. The following four methods are available for PPI data: Most requested statistics, create customized tables (one screen or multiple screens), and flat files. Additional sources of BLS data are also accessible from this page including: Economic news releases, series report, and economy at a glance.

Additional information

The PPI homepage (http://www.bls.gov/ppi) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The "Tables Created by BLS" section found beneath the statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.

For questions or comments regarding PPI data classification, methodology, or data availability on the Internet, call or e-mail the Section of Index Analysis and Public Information directly at (202) 691-7705 or *ppi-info@bls.gov*. Data also can be obtained by calling the national fax-on-demand service at (202) 691-6325; this service enables customers to request faxes of BLS data 24 hours a day, 7 days a week.

^{1/} Data for September 2003 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.
2/ Prices of some items in this grouping are lagged 1 month.

^{*} The preliminary January 2004 index level for this series, shown above as originally published on March 18, 2004, was corrected in a notice on the Bureau of Labor Statistics website on March 26, 2004. See http://www.bls.gov/ppi/notice03262004.htm for the corrected index level and for more information.

^{1/} Indexes in this table are derived from the net-output-weighted industry price indexes. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings.

^{2/} The indexes for September 2003 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

^{3/} Not available.

Note: NAICS 2002 replaced the SIC classification system beginning with the release of PPI data for January 2004.

^{*} The indexes for 493 and 524 should not have been included in this table. These two series do not meet the Bureau of Labor Statistics' standards for accuracy of published data. (Footnote added on March 26, 2004.)
