USDL 06-1232 TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EDT), TUESDAY,

July 18, 2006

Producer Price Indexes – June 2006

The Producer Price Index for Finished Goods increased 0.5 percent in June, seasonally adjusted, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. This rise followed advances of 0.2 percent in May and 0.9 percent in April. At the earlier stages of processing, prices received by producers of intermediate goods climbed 0.7 percent in June after increasing 1.1 percent in the prior month, and the crude goods index fell 1.7 percent following a 2.0-percent gain in May. (See table A.)

r=revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for February 2006 have been revised to reflect the availability of late reports and corrections by respondents.

Among prices for finished goods, the index for consumer foods moved up 1.4 percent in June after decreasing 0.5 percent in May. Prices for energy goods rose 0.7 percent following a 0.4-advance in the previous month. By contrast, the index for finished goods other than foods and energy increased 0.2 percent in June compared with a 0.3-percent rise in May.

During the first 6 months of 2006, the finished goods index rose at a 2.1-percent seasonally adjusted annual rate (SAAR) after moving up at a 7.5-percent SAAR during the latter half of 2005. Leading this slower rate of advance, prices for finished energy goods climbed at a 4.1-percent SAAR from December 2005 to June 2006 after advancing at a 36.3-percent SAAR for the 6 months ended December 2005. The index for finished consumer foods declined at a 2.3-percent SAAR during the first half of 2006 after increasing at a 3.6-percent SAAR during the second half of 2005. By contrast, prices for finished goods other than foods and energy advanced at a 3.1-percent SAAR for the 6 months ended in June after rising at a 0.6-percent SAAR during the prior 6 month period. At the earlier stages of processing, the intermediate goods index increased at a 6.6-percent SAAR from December 2005 to June 2006 after moving up at a 12.1-percent SAAR during the latter half of 2005, and prices for crude goods fell at a 19.1-percent SAAR for the 6 months ended in June after surging at a 46.1-percent SAAR for the 6 months ended December 2005. (See summary table below.)

Summary of December-to-December, 6-month, and 3-month seasonally adjusted annual rates for

selected stages of processing

		ntage ch		Seasonally adjusted annual rate for					
Grouping		onuns er Decembe		6 months ended	3 months ended	3 months ended	3 months ended

Crude nonfood materials less energy	21.6	20.5	5.2	37.1	11.5	15.2	63.1		

NOTE: Late reports and corrections by respondents may cause some indexes to change 4 months after original publication. In addition, seasonally adjusted indexes may be revised for 5 years due to the recalculation of seasonal factors each January.

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.3 percent in June to 161.7 (1982 = 100). From June 2005 to June 2006, prices for finished goods increased 4.9 percent. Over the same period, the index for finished energy goods climbed 19.1 percent, prices for finished goods other than foods and energy advanced 1.9 percent, and the index for finished consumer foods rose 0.6 percent. For the 12 months ended June 2006, prices received by intermediate goods producers moved up 9.3 percent, and the crude goods index increased 8.6 percent.

Finished goods

The index for finished consumer foods rose 1.4 percent in June following a 0.5-percent decrease in May. Prices for processed young chickens jumped 12.1 percent after edging down 0.2 percent in the preceding month. Also turning up in June were the indexes for eggs for fresh use, fresh fruits and melons, and dairy products. Prices for fresh and dry vegetables declined less in June than they had a month earlier, while the indexes for pork and confectionery end products increased more than in May. Conversely, beef and veal prices moved up 0.4 percent in June following a 2.3-percent gain in the prior month. The indexes for soft drinks and bakery products also advanced less than they had in the previous month. (See table 2.)

r=revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for February 2006 have been revised to reflect the availability of late reports and corrections by respondents.

Prices for finished energy goods rose 0.7 percent in June after moving up 0.4 percent in May. Leading this acceleration, the gasoline index climbed 6.3 percent following a 2.2-percent increase in the preceding month. Prices for home heating oil and diesel fuel also rose more in June than they had a month earlier. The index for lubricating and similar oils, which was unchanged in May, advanced in June. By contrast, prices for residential electric power fell 2.8 percent in June after inching up 0.1 percent in the prior month. The index for residential natural gas declined at a faster rate than it had in May, while prices for liquefied petroleum gas and kerosene rose less than in the previous month.

The index for finished goods other than foods and energy increased 0.2 percent in June following a 0.3-percent advance in May. In June, rising prices for passenger cars, light motor trucks, civilian aircraft, pharmaceutical preparations, alcoholic beverages, and mobile homes outweighed falling prices for platinum and karat gold jewelry; home electronic equipment; electronic computers; and women's, girls', and infants' apparel.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components rose 0.7 percent in June following a 1.1-percent advance in the prior month. Prices for materials for durable manufacturing, intermediate energy goods, materials and components for construction, and materials for nondurable manufacturing also increased less than they had in May. By contrast, the index for intermediate foods and feeds turned up after falling in the previous month. Prices for intermediate goods other than foods and energy moved up 0.8 percent in June compared with a 1.1-percent jump in May. (See table B.)

The index for materials for durable manufacturing climbed 1.1 percent in June after rising 4.4 percent in May. Hot rolled steel sheet and strip prices increased 5.6 percent in June after gaining 7.9 percent a month earlier. The index for aluminum mill shapes also advanced less than it had in May. Prices for primary nonferrous metals, copper and brass mill shapes, softwood lumber, and for building paper and board turned down after rising in the previous month. By contrast, the index for cold rolled steel sheet and strip increased 8.4 percent in June compared with a 1.2-percent gain in the preceding month. Prices for hot rolled steel bars, plates, and structural shapes also advanced more than they had in May. The index for thermoplastic resins turned up after declining in the prior month. (See table 2.) From December 2005 to June 2006, the index for materials for durable manufacturing jumped at a 22.0-percent SAAR after moving up at an 11.2-percent SAAR in the previous 6-month period.

The intermediate energy goods index advanced 0.4 percent in June after increasing 1.0 percent in the preceding month. The increase in the index for residual fuel slowed to 7.3 percent from 10.3 percent in May. Prices for both industrial and commercial natural gas fell more than in the preceding month. The index for natural gas to electric utilities turned down in June after increasing a month earlier. By contrast, prices for industrial electric power turned up 0.9 percent after falling 0.8 percent in May. The index for commercial electric power also rose after declining in the previous month. Prices for gasoline, jet fuel, and home heating oil advanced more than in the prior month. The index for intermediate energy goods moved up at a 4.4-percent SAAR during the first half of 2006 after climbing at a 36.0-percent SAAR in the second half of 2005.

Subsequent to a 1.2-percent gain in May, prices for materials and components for construction increased 0.3 percent in June. The index for paving mixtures and blocks rose 2.6 percent after advancing 7.1 percent in the previous month. Prices for nonferrous wire and cable, softwood lumber, gypsum products, and for building paper and board turned down in June following increases in the prior month. The treated wood index fell after showing no change in May. Alternatively, prices for fabricated structural metal products went up 1.1 percent in June, after rising 0.6 percent in the preceding month. The index for steel mill products also advanced more in June, and prices for wiring devices turned up from declines in May. The index for air conditioning and refrigeration equipment moved up after showing no change in the previous month. During the first half of 2006, the index for materials and components for construction advanced at a 7.7-percent SAAR after increasing at the same rate in the second half of 2005.

Prices for materials for nondurable manufacturing moved up 1.0 percent in June after increasing 1.4 percent a month earlier. The increase in the index for paperboard slowed to 1.0 percent from 5.3 percent in May. The indexes for inedible fats and oils, phosphates, aluminum compounds, and finished fabrics turned down in June after moving up in the prior month. By contrast, prices for plastic resins and materials advanced 1.3 percent following a 1.2-percent drop in the preceding month. The index for intermediate basic organic chemicals also turned up in June. Prices for primary basic organic chemicals and paper rose more in June than they had in May. From December 2005 to June 2006, prices for materials for nondurable manufacturing climbed at an 8.2-percent SAAR after rising at a 14.8-percent SAAR from June to December 2005.

The intermediate foods and feeds index moved up 1.0 percent in June following a 0.2-percent decline in the prior month. Prices for shortening and cooking oils advanced 0.8 percent after falling 1.7 percent in May. The indexes for processed young chickens; natural, processed, and imitation cheese; and confectionery materials also turned up in June. Prices for prepared animal feeds were unchanged in June after decreasing a month earlier. The pork index rose more than in the previous month. Conversely, the index for beef and veal increased 0.4 percent in June after advancing 2.3 percent a month earlier. Prices for flour also rose less than they had in May. The index for soft drink beverage bases was unchanged after moving up a month earlier. Prices for intermediate foods and feeds declined at a 1.5-percent SAAR in the first half of 2006 after increasing at a 0.6-percent SAAR in the prior 6-month period.

Crude goods

The Producer Price Index for Crude Materials for Further Processing declined 1.7 percent in June following a 2.0-percent increase in May. Prices for crude energy materials fell after rising in the previous month. The index for basic industrial materials increased less than it had in May. By contrast, prices for crude foodstuffs and feedstuffs turned up following declines in the prior month. (See table B.)

The index for crude energy materials fell 6.8 percent in June after increasing 2.5 percent in the preceding month. Leading this downturn, prices for natural gas dropped 10.8 percent following a 2.3-percent gain in May. The index for crude petroleum decreased 3.7 percent after rising 3.8 percent in the prior month. Alternatively, coal prices were unchanged following a 2.2-percent decline in May. (See table 2.) During the first half of 2006, the crude energy materials index decreased at a 36.9-percent SAAR after rising at an 83.8-percent SAAR in the previous 6-month period.

Prices for crude nonfood materials less energy increased 1.7 percent in June after a 6.2-percent rise in the prior month. The iron and steel scrap index advanced 6.2 percent following a 6.8-percent gain in May. Prices for gold ores, both copper and aluminum base scrap, and wastepaper fell after increasing in the previous month. By contrast, the raw cotton index declined 0.6 percent in June following a 13.0-percent decrease in the preceding month. Prices for miscellaneous metal ores turned up, while the index for hides and skins rose more than it had in May. From December 2005 to June 2006, the index for basic industrial materials increased at a 37.1-percent SAAR after rising at a 30.4-percent SAAR in the second half of 2005.

The index for crude foodstuffs and feedstuffs advanced 4.8 percent compared with a 2.3-percent decline in May. Slaughter cattle prices increased 2.5 percent in June after falling 5.2 percent in the preceding month. Prices for fluid milk, Irish potatoes for processing, fresh fruits and melons, and alfalfa hay also turned up. The indexes for slaughter hogs and for slaughter broilers and fryers rose more in June than they had a month earlier. Alternatively, prices for soybeans fell 1.4 percent following a 5.9-percent gain in May. The index for corn also decreased after rising in the previous month. The index for crude foodstuffs and feedstuffs declined at a 13.9-percent SAAR in the first half of 2006 after increasing at a 6.9-percent SAAR in the prior 6-month period.

Net output price indexes for mining, manufacturing, and services industries

Mining. The Producer Price Index for the Net Output of Total Mining Industries declined 4.4 percent in June after rising 3.1 percent in May. (Net output price indexes are not seasonally adjusted.) The majority of this downturn can be attributed to prices received by the oil and gas extraction industry group, which declined 6.5 percent following a 3.2-percent gain in May. Prices received for gold ore mining and for oil and gas well drilling also turned down in June. The index for the bituminous coal underground mining industry fell more than in the previous month. The index for potash, soda, and borate mineral mining was unchanged in June following an increase in the prior month, and prices received by the construction sand and gravel mining industry rose less than in May. By contrast, the index for oil and gas operations support activities increased 1.8 percent following a 0.3-percent decrease in May. Prices received for bituminous coal and lignite surface mining also turned up in June. During the first half of 2006, the Producer Price Index for the Net Output of Total Mining Industries declined at a 25.3-percent annual rate compared with a 73.5-percent rate of increase in the second half of 2005. In June 2006, this index was 202.7 (December 1984 = 100), 13.8 percent above its year-ago level.

Manufacturing. The Producer Price Index for the Net Output of Total Manufacturing Industries increased 0.6 percent in June following a 0.9-percent gain a month earlier. The industry group index for petroleum and coal products advanced 3.0 percent after increasing 4.3 percent in May. Prices received by manufacturers of electrical equipment, appliances, and components and by producers of primary metals also rose less than they had in the prior month. The industry group indexes for wood products, plastic and rubber products, computers and electronic products, and medical equipment and supplies turned down in June. Alternatively, prices received by food manufacturers moved up 1.2 percent subsequent to a 0.6-percent increase in May. The industry group index for transportation equipment was unchanged after falling in the previous month, while the beverage and tobacco industry group index increased after remaining unchanged in May. From December 2005 to June 2006, the Producer Price Index for the Net Output of Total Manufacturing Industries rose at an annual rate of 9.0 percent following a 4.3-percent rate of increase from June to December 2005. In June 2006, this index was 159.5 (December 1984 = 100), 6.6 percent higher than its year-ago level.

Services. Among services industries in June, prices received by commercial bankers advanced 5.8 percent after decreasing 2.2 percent in May. The industry indexes for scheduled passenger air transportation, cellular and other wireless carriers, portfolio management, passenger car rental, lessors of nonresidential buildings (excluding miniwarehouses), and for investment banking and securities dealing also turned up in June. Conversely, prices paid for engineering services edged down 0.1 percent following a 1.3-percent rise in the previous month. The industry index for long distance general freight trucking (less than truckload) also turned down in June.

Producer Price Index data for July 2006 are scheduled to be released on Tuesday, August 15, 2006, at 8:30 a.m. (EDT).

Brief Explanation of Producer Prices Indexes

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 8,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

Commodity Indexes

The commodity classification structure of the PPI organizes products by similarity of end use or material composition, disregarding industry of origin. Fifteen major commodity groupings (2-digit commodity codes) make up the All Commodities Index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8-digit). Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes and corresponding percent changes will be virtually identical to their industry-based counterparts, even if their index levels differ.

Industry Net-Output Price Indexes

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes); Census product classes (7- and 8-digits), products (9-digits), and more detailed subproducts (11-digits); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Data Collection

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted primarily through the mail.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of unit dollar prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced industries includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

Weights

DDI Datailad

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 1997 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1996 through December 2001, PPI weights were derived from 1992 shipment values. Industry indexes also are now calculated with 1997 net output weights. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities, are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. This document can be downloaded from the BLS Web site at (http://www.bls.gov/opub/hom/homch14_itc.htm), and reprints are available on request.

Calculating Index Changes

Each PPI measures price changes from a reference period which equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: Prices received by domestic producers of a sample of finished goods have risen from \$100 in 1982 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

Index point change	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
Index percent change	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy, because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited when escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, available on request from the BLS.)

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is re-evaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (6-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information relating to seasonal adjustment methods, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

Producer Price Index Data Via the Internet

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, usage of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 1.6 million accesses of PPI series over the Internet during the 12 months ended December 31, 2003.

Retrieving PPI data from the PPI Website

PPI data can be obtained from the WWW address (http://www.bls.gov/ppi). Scrolling down the page to the "Get Detailed Statistics" header reveals the following 5 methods of data retrieval:

- *Most Requested Series* is a form-based application that allows the user to quickly obtain PPI time series data by selecting from two separate lists (commodity and industry) of the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.
- Create Customized Tables is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides a user through the PPI classification system by listing index titles and does not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user's browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple screen, nonJava-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Using the one-screen option, users can modify the date range and output options after executing the query using the reformat button above the data output table.
- *Series Report* is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at one time.

There are three basic formats for creating a unique PPI time series identifier. For commodity and stage-of-processing indexes, enter a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted) in combination with a commodity-based code to create a series identifier.

Commodity code Will provide data for:

wps063 Drugs and pharmaceuticals, seasonally adjusted wpu063803 Pharmaceutical preparations, cardiovascular system

wpusop3000 Finished goods, not seasonally adjusted

For a current industry-based price index organized according to the North American Industry Classification System (NAICS), enter the prefix "pcu" followed by the industry-product code. The series identifier for products primary to an industry include 12 numeric digits, the six-digit industry code is repeated, and up to seven additional digits of product detail. Dashes are used as place holders for higher-level industry group codes.

Industry-product code,
Current NAICS series

pcu325---325--pcu336110336110

pcu621111621111411

Will provide data for:

Chemical manufacturing, not seasonally adjusted
Automobile and light duty motor vehicle manufacturing

Offices of physicians, one and two physician practices and single specialty group practices,
general/family practice

To identify a discontinued industry-product code based on the Standard Industrial Classification (SIC), enter a "pdu" prefix and "#" between the fourth and fifth characters of the product code. A series identifier for the discontinued dataset uses underscores as placeholders to complete a reference to an SIC industry group code of less than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of the NAICS.) *In all cases, no spaces are permitted.*

Industry-product code, Discontinued SIC series pdu28_# Chemicals and allied products, not seasonally adjusted pdu331_# Blast furnaces, steel works, and rolling and finishing mills, not seasonally adjusted pdu3711#111 Passenger cars

• *Flat Files* and the FTP server are best suited for those users requiring access to either a large volume of time series data or other PPI-related documentation (such as, seasonal factor and relative importance tables). The FTP site can be accessed at (ftp://ftp.bls.gov) or directly from the links on the "Get Detailed Statistics" page or the PPI homepage. Data and documentation available for download include:

Directory:

NAICS Current Series

SIC Discontinued Series

Commodity Series

pub/time.series/pd

pub/time.series/wp

pub/time.series/wp

pub/special.requests/ppi

Latest News Release

Directory:

pub/time.series/pd

pub/time.series/wp

pub/special.requests/ppi

pub/news.release/ppi.txt

The FTP site maintains files to help with searches and downloads. These files are centrally located in the /pub/doc directory. Within this directory, go to the overview.txt file for an overview relating to all BLS data available through the FTP site. For commodity-based PPI data (which appear in tables 1, 2, 3, 6, 7, and 8 of the PPI monthly detailed report and tables 1, 2, 3, and 5 of the monthly news release), the program help file is wp.txt. For current industry-based PPI data based on the NAICS (which appear in tables 4, 5, and 9 of the monthly PPI report and table 4 of the monthly news release), the file is pc.txt. For industry-based SIC time series that have been discontinued, go to pd.txt. (These and other help files are also maintained within each of the five directories listed above.)

Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (http://www.bls.gov). After clicking the "Get Detailed Statistics" link at the top of the homepage a chart appears listing all of the available BLS programs. The following four methods are available for PPI data: Most requested statistics, create customized tables (one screen or multiple screens), and flat files. Additional sources of BLS data also are accessible from this page including: Economic news releases, series report, and economy at a glance.

Additional information

The PPI homepage (http://www.bls.gov/ppi) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The "Tables Created by BLS" section found beneath the statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.

For questions or comments regarding PPI data classification, methodology, or data availability on the Internet, call or e-mail the Section of Index Analysis and Public Information directly at (202) 691-7705 or *ppi-info@bls.gov*. Data also can be obtained by calling the national fax-on-demand service at (202) 691-6325. This service enables customers to request faxes of BLS data 24 hours a day, 7 days a week.

Table 1. Producer price indexes and percent changes by stage of processing (1982=100)

 	Relative importance	Unadjusted index			Unadjusted percent change to June 2006 from:		 Seasonally adjusted percent change from:

^{1/} Indexes in this table are derived from the net-output-weighted industry price indexes. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings.

Note: NAICS 2002 replaced the SIC system beginning with the release of PPI data for January 2004.

^{2/} The indexes for February 2006 have been recalculated to incorporate late reports and corrections by respondents.
All indexes are subject to revision 4 months after original publication.

^{3/} Not available.
